Council of Architecture Reg. No.: CA/2018/102783  
Telephone: +91 9326773470  
Email: sonawaneaniket037@gmail.com

My name is Aniket Sonawane. I've completed my bachelors of architecture (B-Arch) from Mumbai University and recently completed my Masters in advanced architecture (MAA-02) from the Institute for Advanced Architecture, Catalonia, Barcelona.

I have worked for 2 years and gained experience in designing residential projects, from private bungalows to residential building complexes. During my master's degree, I learned computational and parametric design, as well as digital fabrication of these algorithmic complex geometries.

Currently, my interest lies in using parametric design and advanced construction strategies in the built environment we live in.

## Education

2020 - 2022

### MAA - 02 (Masters in Advanced architecture)

Institute for Advanced architecture Catalunya (IAAC Barcelona).

2012 - 2017

### B.Arch.

Hiray college of Architecture (Mumbai University, Mumbai).

## Research

2021 - 2022

Print N Place.

Thesis research on developing clay 3D printed interlocking blocks for compressive structures.

## Award

2021

Institute for advanced architecture Catalunya

Sulf sufficient building award - Best studio project

## Experience

2018 - 2019

1 year

Junior Architect in M. S. Bakshi and Associates (Thane).

Designed various residential apartment buildings according to by laws of Thane.

2017 - 2018

1 year

Junior Architect in M.A.D.S (Morphogenic Architectural Design Studio) (Pune).

Designed private residences and interiors.

2016

4 months

Intern at ADS4 Architecture Design Studio (Bangalore) Ar. Durga Prasad.

Facade designing for residential buildings and site visits for on-going projects

2015 - 2016

4 months

Intern at RamamurthiHombaliAssociates (Bangalore) Ar. Arunachal Hombali.

Conducted various surveys and gathered data for urban designing of Indian institute of Science, Bangalore

## Skills

### Software

Rhino

Grasshopper

Revit

Auto Cad

Sketch Up

Animations and video editing

Premier Pro

Rendering and visualisation

V - Ray

Lumion

Adobe creative suite

### Fabrication

Robotic arm manufacturing

Concrete and Clay 3D printing

Lazer cutting

CNC milling

3D printing

Physical modeling

### Languages

Marathi (Native)

Hindi (Fluent)

English (Fluent)

Spanish (Learning)

## Workshops

2015

LBC - Laurie baker workshop on sustainable low cost building technology

2016

Earth institute - Understanding compressed earth blocks.

2019

Desing intervantions - Online workshop for rhino and grasshopper

2018

Climate consultant - Online workshop for climate analysis for architecture.

## 2.1 PROXIMA AREA VERDE

The architecture of algorithms

### **Project discription**

Studio project - laac

Objective is to design using continous minimal surfaces.

Software - Rhino, Grasshopper (Mesh subd)

Digital fabrication - Lazer cutting

Material - polypropylene sheet

### **Abstract**

#### **Proxima area verde - The next green space**

*Proxima Area Verde is the next green area and cultural habitat located in Poble Nou. The project is understood to be an extension of an extensive network of green spaces and biodiversity within the city of Barcelona, following the development movement of Placa de les Glories. With this intervention, we intend to build an open space for people from creative and cultural disciplines to work, exhibit, and introduce their creations into the public realm. Using the methodology of continuous surfaces, and using tools for complex forming and other tools of algorithmic architecture, we attempt to create a space, that in its character expresses the qualities and complexities of a jungle. The jungle, as we know, is the most biodiverse space on our planet, and we try to incorporate three of its distinct characteristics – Entanglement, Permeability, and Layers. The objective is to identify the difficulties and constraints offered by the site, to turn them into opportunities, and to develop programmatic interventions to overcome them. With that in mind, we also attempt to bridge the gap between the two neighborhoods—both physical and cultural. With Proxima Area Verde, we marry the cultural aspect of the typology to the green aspect of the morphology by developing a sustainable green space using bio-receptive concrete for the structure to facilitate the growth of bryophytes (moss) to tackle environmental problems such as air pollution and urban heat islands.*

## Site analysis

Vehical and pedestrian movement

### Train route

### Bus stops

### Footpaths

## Opportunities

### Green infiltration

1. Disconnect between the two sides of the Diagonal.
2. Site is a neglected space waiting to be a part of the green axis with Glories.
3. According to Barcelona green infrastructure and biodiversity plan, Site is marked as the next green area.

### Bridging the gap

1. Major level difference around the site due to the tram line.
2. Issue of road block.
3. Pedestrian access only on one side.

### Public engagement

1. Lot of artistic spaces in Poblenou because of the 22@ plan. But they are limited and formal spaces.
2. There is a potential on the site to create a congregation for artists.

## Objectives

- |   |   |   |
|---|---|---|
| <ol style="list-style-type: none"> <li>1. Become a part of the green line across Glories as the Proxima Area Verde.</li> <li>2. Convert this neglected space and merge it with the green corridor.</li> </ol> | <ol style="list-style-type: none"> <li>1. Connect the levels around the site.</li> <li>2. Fix the issue of road block</li> <li>3. Connect it using audio+visual means.</li> </ol> | <ol style="list-style-type: none"> <li>1. Locate and identify the different activities around the site.</li> <li>2. Bring in different activities and congregation spaces on the site.</li> </ol> |
|---|---|---|

## Concept - Jungle

The jungle is the most bio-diverse region on the earth and all the plants and animals help eachother maitain the ecosystem. Entanglement, Permiability and layers are some major characteristics of the jungle. Like every organism resonates withwith every element of nature, the structure also entangles itself with the nature.

### Entanglement

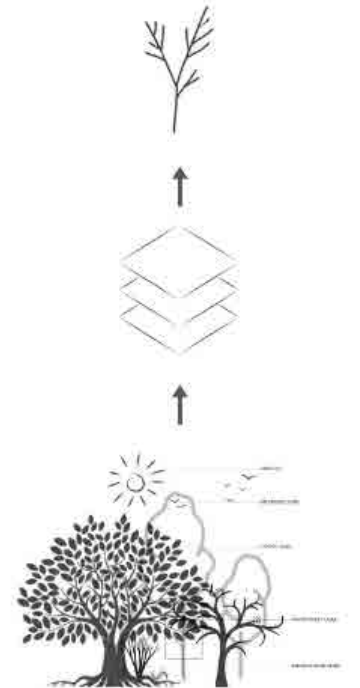

Derieved into program

### Premiability

Derieved into objectives

### Layers

Derieved into design

## Program

Floor

Floor and Roof

Roof

The floor acts as pathways, Dog walk-ways, connection of the gap outside the site

The spaces where floor and roof merge can act as gallery and exhibition spaces

The roof forms the green channel across the site connecting the bigger scale Glories project

The spaces without roof can act as open air theatres or spaces for art installations.

Spaces where Floor and Roof exist act as leisure and refreshment areas with cafeterias and congregation spaces

The roof also acts as ramps, connecting the different layers of the site

## 2.2

# LIGHTS OF FORTUNE

After Gaudi

### **Project discription**

Studio project - laac

Objective is to design by carving out the shape of hyperboloid from a wall to optimise radiation and light.

Software - Rhino, Grasshopper

Physical Fabrication - Sculpting

Material - polypropylene sheet

### **Abstract**

#### **Lights of fortune**

A hyperboloid, or hyperbola in revolution, is a shape generated by revolving a hyperbola around a center. The hyperboloid is a self-supporting shape and is primarily used as a structural member for its excellent load distribution properties.

Contrary to traditional architectural thinking, Antonio Gaudi implemented hyperboloid in a totally different way. In Gaudi's eyes, the hyperboloid is perfect for light passing through because of its funnel-like shape with two wide-open ends. He placed hyperboloid structures either on the walls or roofs as windows, serving for illumination. When light comes from the exterior, it is first compressed and then diffused into the interior.

The project Lights of Fortune uses this concept to derive light for the exterior to get diffused light to create a pleasant ambience in the interior in the harsh sun of Singapore, as well as get direct light in a pattern for a divine experience.

The hyperboloids are used to carve the shapes in a wall to get the desired output by arranging the location distance and direction on the wall using advanced computational design to achieve a geometric pattern that is not only beautiful but serves the purpose of radiation optimization.

The designing wall is physically fabricated using sculpting techniques, then arranged by cutting and combining to get the geometry with the triple point.

Animations and blog post

## Understanding hyperboloid

The curve obtained by rotating one of the two circles or ellipse connected together is called hyperbola. By revolving this curve, we get a shape called a hyperboloid. Hyperboloid structures are double curved and are simultaneously curved in opposite directions. They are very resistant to buckling. By intersecting these hyperboloids and carving the space inside, we get interesting patterns that can be used architecturally. By understanding its ruled surface properties, we carve the hyperboloid to fit together to make a facade.

## 2.3 FALLING WATER - 2021

Self Sufficient Buildings - One<sup>3</sup> house

### **Project discription**

*Studio project - laac*

*Objective is to design and make working model of a house using a scientific phenomennon.*

*Softwares - Rhino, Grasshopper, Arduino*

*Digital fabrication - CNC milling and Physical programming*

*Materials - Burch Plywood and acrellic*

### **Abstract**

#### **Falling water 2021 - Slef sufficient buildings**

*Falling Water 2021 is a group project done in the design studio of self-sufficient buildings in which the objective was to design a house for a man for a year by understanding a scientific phenomenon to implement in the building to make it self-sufficient in a way.*

*With water making up 70% of both planet earth and the human body, we dive into the relationship between human, architecture and water to explore the extent to which water can define the spaces we inhabit and our lifestyle in relation to it. Energy, being intangible, is difficult to visualize, but water holds the ability to carve, move, reflect, and respond, and its power is a medium with which we can make this energy evident. We explored the phenomenon of gravitational potential energy in order to circulate water and to shape a new way of living in response to the environment.*

Scan !!!

*Animations and blog post*

## Working drawing of experiment

Gravitational potential energy is the energy stored as a result of its vertical position or height. Hence, the greater the height, the higher the energy. We explored the potential of this phenomenon through a hydropneumatic water system. With this system, we are able to circulate water vertically while optimising the distance and speed at which the water can travel.

Water and pressure transfer pipes

Arduino uno

Humidity sensor

LED display

## Working drawing of turbine

To literally 'test the waters' we were stepping into, we designed a device to calculate the speed of water in the river. The device is made up of four elements: the turbine, the rotary sensor and gear, and a vertical structure that contains it.

This device is inserted into the river bed so that the turbine is submerged in the water and spins with the flow of water. The number of rotations per minute is studied, and this data enables us to calculate the speed of the water.

By inserting our device into different locations along the river, we were able to find the ideal location for the house. It was tested in the centre of the river, which had the maximum depth and the highest flow of water.

## Falign water 2021 - One<sup>3</sup> house

We designed our own evaporative cooling facade to reduce the speed at which water flows through it and to control the path of flow to the desired locations. By testing the same quantity of water against time, we derived the shape of the pattern within the facade.

The facade was designed parametrically to relate to the spaces within the house. The spaces, which need to be cooled more, have a denser pattern to hold more water. The Genetic Solver evaluates thousands of iterations to find the maximum amount of water that the facade can hold while falling. The graph indicates all the different possible solutions of the genetic solver.

To what extent can water define the space we inhabit and can our lifestyle revolve around changes in water relative to the environment?

## Climb

Thesis project - B Arch

### **Project discription**

Thesis project - B Arch

Objective is to design a sustainable and low cost mountaineering institute .

Softwares - Auto Cad, Sketch Up, Lumion

### **Abstract**

#### **Climb**

Adventure sports has interested many people and is current doing so. Adventure sports are dangerous, so one must acquire professional training to pursue them as a sport. Currently, there are four mountaineering institutes in India. All of these institutes being in the Himalayas, in the south of India, there is scope for such an institute in sahayadries. With the Sahayadris and Nilgiris being equally challenging as the Himalayas, it could be an ideal space for a mountaineering institute.

Climb as a project aims to design an institute for mountaineering and allied sports in Sahayadris. (western ghats) This institute will create an opportunity and introduce men, women, and children to the mountains and nature through its various mountaineering and adventure courses. The courses are designed to develop a person physically and mentally so as to sustain them in nature.

The project is designed using the guidelines of sustainable and low-cost development inspired by architect Laurie Baker, using exposed concrete and brickwork to enhance its connection with nature around it.

## 2.5

# URBAN HOUSING

Professional work

### **Project discription**

*Professional project*

*Objective is to design a rehabilitation housing project*

*Softwares - Auto Cad, Sketch Up, V Ray*

### **Abstract**

#### **Urban Housing**

*"Mumbai", a metropolitan city and the economic capital of India, holds a lot of scope for urban development. People all around India and the world are attracted to this city because of its amazing job and business opportunities. The current population of Mumbai is 22.5 million and is growing at a rate of 17–20% per decade. Around 41.5% of people in the city are living in slums, and there is a huge need for the basic commodity of life, "housing".*

*The project urban housing is to develop housing complexes (towers) with both affordable and luxurious apartments in Mumbai. The objective is to design high-rise towers for LIG (low income group), MIG (middle income group), and HIG. (high income group). Catering to a high population of people, there is a need to think about open recreation space and social interaction between people.*

## Redevelopment project Mumbai - sub

This housing project consists of five residential towers of different categories of apartments. The complex has 650 apartments, so vehicular parking is most needed. There are 3 levels of podium for vehicular parking, which are easily accessible via two, two-way ramps which are designed for smooth vehicular circulation. The level difference subtly divides the site from rehabilitation building to sale building. There are 3 recreation grounds, one on each podium level. There is a senior citizen garden on ground level, as most Indian families are joint families. This helps them relax and spend quality time with fellow senior citizens. The other two RGs are for children and teenagers for their much faster sports.

The towers are placed so that each house gets direct natural light and ventilation. No two buildings directly face each other, and in a complex of 650 apartments, each one has its own complete privacy. The central open space allows the wind to flow in its natural way and creates enough space for good vehicular circulation.

One bedroom apartment building

## Redevelopment project Mumbai - Town

This skyscraper design is highly inspired by the Kanchanjunga apartment building in Mahalaxmi, Mumbai. The building is designed in a 33 x 33 m square, with flat sizes increasing as we go up. The R.C.C column layout changes as we go up, and the transition of changes takes place at the 2 levels of service floors each after 25 floors, which divides the elevation of the tower into 3 sections, giving it a well-designed and contemporary elevation both in front and on the sides.

The rehab tower consists of smaller 1 bhk and 2 bhk flats designed to fit well on the site.

## 3.1

## TIME

### Robotic tufting

#### **Project discription**

*Group project*

*Objective is to design a rug and fabricate using a robotic arm*

*Softwares - Rhino, Grasshopper, Robots(Gh Plugin)*

*Machines used - Robotic Arm*

*Technique - Robotic tufting*

*Material used - Canvas, Yarn*

#### **Abstract**

#### **Time**

*Time is a group project that explores the art of tufting using a robotic arm. The objective is to design a rug and fabricate it using a tufting gun mounted on the robot.*

*The system comprises a canvas board mounted vertically on the table, with a tufting gun used as the tool. The design of the rug is a prism representing illusion, and the drawing for the rug is developed keeping in mind the constraints of tufting, such as the direction of curves, distance between them, and the pressure needed to be applied on the canvas to get the desirable output.*

## 3.2 ROBOTIC STEREOTOMY

Advanced robotic fabrication - Hot wire cutting

## ROBOTIC STEREOTOMY

Advanced robotic fabrication - Hot wire cutting

### Project discription

Group project - Me and Lekha Gajbhiye

Objective is to desing a facade by using robotic stereotomy using the princpal of ruled surfaces

Softwares - Rhino, Grasshopper, Robots(Gh Plugin)

Machines used - Robotic Arm

Technique - Hot wire cutting

Material used - EPS foam blocks

### Abstract

#### Robotic stereotomy - Hot wire cutting

*Robotic stereotomy is a group project developed by me and Lekha Gajbhiye. This project aims to understand the stereotomy of blocks using a robotic arm. The blocks used are EPS foam blocks and are cut using a hot chromium wire which is guided by the robotic arm. By modelling the block in rhino and grasshopper, the toolpath is generated by using planes as targets for the robot, which follows them according to their orientation and order. For modelling the blocks, certain constraints were taken into consideration, such as Avoid the singularity and make comfortable movements for the robot.*

*Make sure that the tool doesn't touch the robot.*

*The toolpath should avoid cutting the model*

*The project objective is to design an aggregating piece using the concept of ruled surfaces and create an effective facade system for the Barcelona Pavillion to enhance the radiation performance of the building as well as enhance the dramatic play of light in and out of the building.*

### 3.3

## PRINT N PLACE

Thesis project - MAA 02

### **Project description**

Thesis project - MAA 02

Objective is to derive a solution to 3D print interlocking blocks for compressive forms

Softwares - Rhino, Grasshopper, Robots(Gh Plugin)

Machines used - Robotic arm

Technique - Robotic 3D printing

Materials - Clay

### **Abstract**

#### **Print N Place**

Historically, arches, domes, and vaults have been the backbone of structural technology for constructing buildings. All of these forms are compressive forms, i.e., They work best in compression. These forms were explored to maximise their load bearing capacity and were developed from shapes like arches, domes, and vaults to pure compressive forms, which are funicular structures.

The rise of computer-aided design and modelling techniques and computational tools have enabled the language of doubly curved surfaces in architecture, and structural concepts are being integrated as organising principles of form, material, and structure. The new digital fabrication methods have furthermore made the realisation of complex forms technically and economically feasible.

The major drawback for constructing generated funicular structures is that they need precise and unique formwork to build, which is only true to the designed shape.

The thesis, *Printing Masonry*, analyses the forces in pure compressive forms to then discretize them into interlocking blocks, which are then 3D printed using locally available material and assembled using minimum formwork. The research concentrates on studying the forces experienced by the structure to develop a mortarless construction system for funicular structures using topological assemblies. Topological assemblies interlock with their contact surfaces. Further, these force-locked elements are kinematically constrained under their own compressive load, which helps the addition of new blocks without the need for supports, hence minimising formwork.
